Week - 1

a, b = Integer
String Name :- " "

by :- Mark = 70.5
↘ Float

Note: python is an interpreter
convert into (0 OR 1)

∴ Assignment statement -> Input

Example :

Input

```
a = input ("Enter a value:")
b = input ("Enter a value:")

R = a + b
print ("R=", R)
```

output

Enter a value: 42
Enter to value: 20
R = 4220

If we have to do R = a/b

so. ∈ integer

a = int (input ("Enter a value"))

b = int (input ("Enter a value"))

Then we will get result.

∴ If we did

20/2 = we will get 9.99 → In decimal

but if 20/8 = 6 (In integer)

⇒ we use % to get the reminder

eg :- 23 % 10

Remminder = 3
